

TNT6800 DOOR INTERCOM SYSTEM

The TNT-6800 intercom system is designed to allow door stations to call a standard telephone or telephone system line input. A door lock may be released by pressing a button on a touch tone keypad.

The TNT-6800 comes with four modules. Each module is capable of providing intercom communication to two door stations. If door unlock capability is desired, then the TNT-6800 will provide intercom communications with door unlock for four doors.

An expansion module, TNT800 may be stacked on the TNT -6800 doubling the capacity to eight doors with door unlock or 16 doors with intercom only. Also, any combination is available such as three doors with door unlock and 10 doors with intercom only.

If the door station is to be located in an entry way which is enclosed with door leading from the outside and then from the entry way to the interior of the building, use a typical telephone handset without keypad to avoid reverberation and echo problems. Order TNT6800 with a specified number of tip and ring outputs and speaker station outputs.

NOTE: Use no wire nuts. Use only phone company approved gel filled crimp connectors.
